

ChengetAI — Summit Speaking Script

Oct 5, 2026 · @Lester

Opening [0:00]

Good morning, distinguished guests, organisers, partners and fellow innovators. It's an honour to be here, and thank you for having me.

(Pause)

My name is Lester Rusike, and this is **ChengetAI**.

“Chengeta” is a Shona word. It means *to protect, to guard*. That's what this project does. It protects people from scams: the many different scams that all end the same way, with someone sending money from their phone.

The problem [0:30]

Think about the messages people receive every day:

“Congratulations, you've been shortlisted for a job. Pay a ten-dollar registration fee to secure your place.”

I'm a UN doctor in Sudan and I've fallen for you 🥰. My bank card is blocked, so please send \$200 on EcoCash for my flight home to see you.

Man of God: your miracle money of KSh 500,000 is ready for release. Sow KSh 2,000 on M-PESA as a faith offering today to unlock it. Do not doubt or the anointing will leave

“Double your money in seven days. Only three slots left.”

“Your government grant is approved. Pay the clearance fee to release it.”

“I sent money to your wallet by mistake. Please reverse it.”

romance scams

fake prophet scams

(Pause)

Fake jobs. Fake investments. Fake loans and grants. Fake bank and telco agents asking for your PIN. Even fake prophets asking for a “seed” offering. The stories are different, but they all end with the same request: **send money from your phone.**

I saw four gaps.

First, scams cross borders, but warnings don't. A number caught scamming in Lagos works perfectly in Accra the next day.

Second, ordinary spam filters don't understand our local scams. They were trained on Western data.

Third, reporting goes nowhere. People are told “report it”, but to whom, and how fast? By then, the money is gone.

Fourth, reporting can be dangerous. If you must give your name to report a scammer, the people most at risk stay silent.

The solution [1:50]

So I built ChengetAI around three steps: **detect, report safely, and get help.**

Because detection alone is not protection.

Detect. Paste any suspicious message into the app, and AI tells you whether it's a scam, suspicious or safe. It **names the type of scam** and explains why, in plain language.

On Android, **Call Guard** checks incoming calls, SMS and WhatsApp calls against our scam-number database. It **never blocks** a call. It warns you, and the choice stays yours.

And soon, you won't even need to open the app. Select suspicious text in WhatsApp, Facebook or your browser, tap **Check with ChengetAI**, and the verdict pops up right there.

Report safely. Reporting is anonymous by default: no name and no account. Before a report is saved, we remove phone numbers, one-time codes, ID numbers and links.

Get help. Every scam type comes with a first step. For a fake job: *“Real employers don't charge you to hire you.”* Then the app shows who to contact in your country, in order. Your wallet provider comes first, because they can still freeze money while it's being sent. Then come the regulator, the police and support lines.

You can also look up any number to see how often it's been reported, and **in which countries**.

What makes it different [3:25]

It's **one app for seven countries**: Zimbabwe, Kenya, Nigeria, Uganda, South Africa, Ghana and Tanzania. They all share one scam database. A scammer reported in Nigeria is visible in Ghana.

AI reads the messages, because scams change constantly. But help contacts are **never** generated by AI. People check them, because *a fake police number is worse than no number at all*.

And one angry report can't brand someone a scammer.

Closing remarks [4:05]

Whatever the scam, ChengetAI makes the message easy to check, a report safe to make, and help easy to find.

Because protecting trust in mobile money protects everything financial inclusion has already achieved in Africa.
